

Steven Spacek Jr

inkwell.enterthelight.com · Local-first writing workspace (solo build, Cursor agentic workflow)

SUMMARY

Engineer who ships production software through **AI-agent workflows** (Cursor Agent/Composer, MCP tool use, and human-in-the-loop review). Built **Inkwell** end to end—a local-first writing workspace with print/ebook export, Electron desktop releases, Supabase cloud sync, and CI/CD—by decomposing work into agent-sized tasks, constraining outputs with skills and docs, and verifying with tests and pipelines.

AGENTIC ENGINEERING

- **Agent-orchestrated delivery:** Scoped features in natural language; iterated across TypeScript/React, SQL migrations, Deno Edge Functions, and GitHub Actions until tests and installers were green.
- **MCP & tool use:** Integrated **Supabase MCP** for schema work, migrations, and debugging instead of manual-only dashboard flows.
- **Context engineering:** Authored agent-readable specs (docs/CLOUD_SYNC.md, print/ebook parity matrix, migration comments) so agents implemented sync conflicts, entitlements, and export rules without re-deriving product logic.
- **Skills as guardrails:** Applied Supabase/Postgres best-practice **agent skills** (RLS, indexing, security) to steer generated SQL and reviews toward production-safe patterns.
- **Verification loops:** Used Vitest and CI (desktop matrix builds, release publish, bundle checks) as acceptance criteria for agent-generated changes.
- **Bounded subsystems:** Structured a large React surface into modules (sync engine, print worker pipeline, entitlements) so agents could modify one area without destabilizing the app.

TECHNICAL SKILLS

Frontend:	React 19, TypeScript, Vite, Tailwind, TipTap (mentions, wikilinks)
Desktop:	Electron, custom protocol, IPC trust, safeStorage auth, electron-updater
Backend:	Supabase Auth, Postgres RLS, Storage, RPC, Edge Functions (Deno)
Sync:	Local-first storage, revision concurrency, conflict UI, durable sync queue
Export:	EPUB/HTML, KDP PDF pipeline, Web Workers, layout fingerprinting
Delivery:	GitHub Actions, Vitest, ESLint, Paddle webhooks, Vercel deploy hooks

FEATURED PROJECT — INKWELL

Inkwell — Local-first writing workspace

Founder / builder · Cursor (agentic development) · 2025–2026 · ~99 commits shipped to production

- **Product:** Chapter-first manuscripts, linked notes, print & ebook formatting, optional cloud library backup; marketing/SEO and tiered subscriptions (Basic/Pro).
- **Cloud sync:** Supabase Storage for library zips, library_heads revision table, RPC push with optimistic concurrency and explicit conflict resolution (keep device / use cloud / download both).
- **Desktop:** Windows/macOS Electron app with secure auth storage, deep links, auto-update via GitHub Releases, and CI that validates cloud credentials in production bundles.
- **Print/ebook engine:** Shared TipTap mark model, worker-based spine pagination, PDF preflight tests, documented parity matrix for maintainability.
- **Monetization:** Paddle Billing checkout and signed webhooks → user_entitlements with tier-aware storage policies.

Stack: TypeScript, React, Vite, Electron, Supabase, Paddle, Vitest, GitHub Actions
